			•	als used when tackling engi	ineerir	ng tasks in relation to		
			n - [K2A_W21]					

1. Student can acquire, integrate, interpret data from literature, database or other properly matched sources, both in English or other foreign language accepted as an international language of communication within Safety Engineering, as well as to draw conclusions, formulate and justify opinions - [K2A_U1]

2. Student can apply various techniques in order to communicate in occupational environment and other environments -[K2A_U2]

3. Student can create, both in English and Polish language, a well- documented report of problems within Safety Engineering, which present the results of their own research - [K2A_U3]

4. Student can prepare and give oral presentation relating to detailed issues within the realm of Safety Engineering in Polish and other foreign language - [K2A_U4]

5. Student has self-study ability and comprehends it - [K2A_U5]

6. Student can apply information-communicative techniques to deal with tasks that are typical of engineering activity -[K2A_U7]

7. Student can, while formulating and solving engineering tasks, discern their systemic and non-technical aspects and also socio-technical, organizational and economic elements - [K2A_U10]

8. Student can come up with a suggestion how to make use of state-of-the art technology (techniques and technology) within products design - [K2A_U12]

9. Student has got the preparation that is indispensable to be able to work in an industrial environment and also knows safety rules connected with a given work along with the ability to impose their use in practice - [K2A_U13]

10. Student can conduct a critical analysis of the ways in which technical solutions function and assess, by means of Safety Engineering, the existing technical solutions, in particular machines, equipment, objects, systems, services and processes [K2A U15]

11. Student Student can suggest some improvements of already existing technical solutions that are typical of Safety Engineering - [K2A_U16]

12. Student can assess the utility of routine methods and tools that are designed for solving simple engineering tasks of practical nature, characteristic to the safety engineering, as well as choose and apply an appropriate method and tools and also use it effectively, bearing in mind non-technical aspects - [K2A_U17]

13. Student can, according to a given specification, design and operate simple equipment, object, system or a process, typical for Safety Engineering, wile using appropriate methods, techniques and tools, as well as solve complex engineering tasks, characteristic of Safety Engineering (including some uncommon ones which possess research component) - [K2A_U18]

14. Student can, according to the given specification, design and operate on a simple equipment, system or a process, which is typical of Safety Engineering, using appropriate and groundbreaking methods, techniques and tools - [K2A_U19]

Social competencies:

1. Student understands the need and knows means how to self-study (first, second and third cycle studies, postgraduate studies, qualification courses)- improving professional, personal and social competence; can argument the need to learn for the whole life - [K2A_K1]

2. Student is fully aware of the responsibility that he has taken for his own work and expresses readiness to comply with the rules of team work as well as responsibility for mutually realized and completed tasks - [K2A_K3]

3. Student can determine some causal relationships in the process of targets implementation and rank pertinence of alternative or competitive tasks - [K2A_K4]

Assessment methods of study outcomes

Formative assessment:

Classes: current/ongoing evaluation (2-5) of assigned tasks;

Projects: current/ongoing evaluation of work progress on a given project;

Lectures: evaluations based on questions relating to the presented materials during the current and previous lectures. Collective assessment:

Classes: average of partial exercises; credits given after achieving at least 3.0;

Projects: evaluation of the presented solution with reference to the chosen project; credits given after achieving at least 3.0; Lectures: written exam (5 open questions presented during the lectures); each question is scored 2-5 points; final result is an average of partial grades; the exam pass equals at least 3.0.

Course description

Rudiments of system approach to safety: safety and products safety management, system and its measures, structures and types, the culture of safety as a context of safety system. Models of selected safety management systems and their elements. Basic theory of project design, paradigms of design, system approach. Introduction to company management in terms of a project. The process of designing SMS (implementation, planning, project termination). Integration with other systems.

Result of average student's workload

Activity		Time (working hours)
1. participation in lecture		15
2. preparations for lecture credit	20	
3. participation in classes	30	
4. preparations for classes credit	20	
5. project	15	
6. preparation of the project		20
Student's wo	orkload	
Source of workload	hours	ECTS
Total workload	130	5
Contact hours	64	3
Practical activities	26	2
