

## COURSE DESCRIPTION CARD - SYLLABUS

Course name

Fundamentals of optimal design

### Course

Field of study

Year/Semester

Education in Technology and Informatics

3/6

Area of study (specialization)

Profile of study

Level of study

Course offered in

First-cycle studies

polish

Form of study

Requirements

full-time

compulsory

### Number of hours

Lecture

Laboratory classes

Other (e.g. online)

15

Tutorials

Projects/seminars

15

### Number of credit points

4

### Lecturers

Responsible for the course/lecturer:

Responsible for the course/lecturer:

dr Marcin Rodak

email: marcin.rodak@put.poznan.pl

tel. 61 665-2175

Wydział Inżynierii Mechanicznej

ul. Piotrowo 3 60-965 Poznań

### Prerequisites

Basic knowledge in mathematics and other areas in the field of study.

Ordered theoretical knowledge in the field of study.

Ability to solve mathematical problems in the field of study.

Capability to search for necessary information in literature, databases, the Internet and in the given sources.

Ability to self-study and self-education.

Ability to use information and communication techniques relevant to the implementation of engineering tasks.

Understanding the need to learn and expand their knowledge throughout their lives.

Understanding non-technical aspects and effects of engineering activities.

Willingness to cooperate in a team.

### Course objective

Presentation in a concise and intelligible form basis for optimum design of constructions, as well as other equipment and technical systems. Emphasizing the design process as an action based on a systemic (holistic) approach, using solutions based on the so-called nature lesson. Presentation of the basic concepts of optimal design, discussion of basic optimization procedures. Overview of the basics of multi-criteria optimization. Presentation of modern optimization procedures using a "nature lesson". Acquiring the ability to find optimal solutions for simple technical systems within the laboratory.

### Course-related learning outcomes

#### Knowledge

1. Possessing the necessary theoretical knowledge on structure optimization to the extent necessary for the field of study.
2. Knowledge of basic concepts and computational procedures necessary for optimal design.
3. Knowledge of development trends, new procedures and calculation methods used in practical design processes.
4. Understanding the systemic aspects of engineering activities, including activities in the field of optimal design.

#### Skills

1. Ability to apply selected optimization procedures, the ability to use optimization procedures contained in mathematical packages.
2. Finding optimal solutions for simple technical systems.
3. Understanding the importance of a system approach to the problem of optimization.
4. Ability to use methods found in nature to solve complex technical problems.
5. A student is able to assess various design options and identify the optimal solution taking into account many different criteria.

#### Social competences

1. Understanding the need for self-study associated with the development of technology.
2. Appreciating and understanding the social and systemic effects of engineering activities.

3. Understanding the importance of teamwork.
4. The ability to make the right decisions and making decisions relevant to the problem.

### Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture: assessment based on a written exam:

3.0 - 50,1%-60,0%

3.5 - 60,1%-70,0%

4.0 - 70,1%-80,0%

4.5 - 80,1%-90,0%

5.0 - 90,1%-100,0%.

Project: assessment based on a completed project.

### Programme content

Introduction to the basics of optimal design of engineering structures. Basic concepts and terms of optimization (criteria, decision variables, limiting conditions). Discussion of construction models and optimization models. Classification of optimization problems.

Optimization of the function of one variable - analytical and numerical methods.

Non-linear programming without constraints - necessary and sufficient conditions for the existence of extremum, optimization procedures.

Nonlinear programming with constraints - necessary and sufficient conditions for the existence of an extreme (Lagrange function, Kuhn-Tucker conditions), numerical methods for searching for a minimum of a function (methods with a penalty function).

Multi-criteria optimization - theoretical foundations and explanation of optimization procedures.

### Teaching methods

Live lecture with multimedia illustrations.

Project - individual student project work, discussion.

**Breakdown of average student's workload**

	Hours	ECTS
Total workload	90	4,0
Classes requiring direct contact with the teacher	30	1,5
Student's own work (literature studies, preparation for project classes, preparation for exam, project preparation) <sup>1</sup>	60	2,5

<sup>1</sup> delete or add other activities as appropriate
