

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Technologia materiałów polimerowych (Technology of polymer materials)

Course

Field of study

Year/Semester

Technologia chemiczna (Chemical Technology)

I/2

Area of study (specialization)

Profile of study

Technologia polimerów (Polymer Technology)

general academic

Level of study

Course offered in

Second-cycle studies

Polish

Form of study

Requirements

full-time

compulsory

Number of hours

Lecture

Laboratory classes

Other (e.g. online)

30

45

Tutorials

Projects/seminars

Prerequisites

Student starting this subject should have knowledge of the basic principles of general, organic including polymer chemistry, physical chemistry, and chemical engineering.

Student knows and applies good practices of laboratory work, is able to operate the scientific equipment as well as is able to search for information in scientific literature, databases and other properly chosen sources.

Course objective

To introduce students to the technology of polymer production, methods of their modification, as well as properties, processing and areas of application of polymeric materials. Students acquire skills related to polymer synthesis, polymer modification and plastic analysis methods.

Course-related learning outcomes

Knowledge

Student has expanded and well-established knowledge in the field of polymer chemistry and other related areas of science, allowing to formulate and solve complex tasks related to polymer technology (K_W2). The student has a well-established and expanded knowledge of the techniques of industrial polymer synthesis and modification of polymer properties during synthesis (K_W11). Student has established knowledge of occupational health and safety in the polymer chemistry laboratory (lists and applies health and safety regulations) (K_W10).

Skills

Student has the ability to obtain and critically evaluate information from literature and other sources (K_U1). Student works in a group to prepare and perform experiments in the laboratory (K_U2). Student has the ability to present the results of laboratory exercises in a concise and proper manner (K_U6). Student has the ability to analyze and interpreting of the results of experiments from the area of polymer chemistry and technology. (K_U21). The student has the ability to use the knowledge acquired under the specialty in a professional career (K_U23). Student knows and obeys the safety rules related to the work performed (K_U19).

Social competences

Student is conscious of limitations of science and technology in the area of polymer chemistry, including environment protection (K_K2). Student is conscious of limitation of his knowledge and understands the need of further continuous education in area of polymer chemistry (K_K1). Students can work in a team and are aware of their responsibility for their work and responsibility for the results of the teamwork (K_K4).

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture. Written exam (test) from the area of polymer technology presented during the lectures (student obtains a pass by achieving at least 51% of points).

Laboratory classes. The grade consists of the obligatory performance of all laboratory exercises included in the program, positive grades from theoretical preparation for exercises (tests consisting of 3 to 5 questions), activity during classes, method of conducting experiments and preparation of reports.

Projects. Determining the final grade on the basis of partial grades received during the semester: preparation for current classes - performing the next stage of project work on the basis of multimedia presentations of individual stages of the project in the selected field of polymer technology, activity during classes, the ability to solve the problems posed and the method of presenting the results obtained - passing the completed project.

Programme content

The lecture covers the following topics:

Historical outline of polymer chemistry and technology.

Areas of application of polymeric materials.

Carbochemical and petrochemical raw materials for the production of polymers and plastics.

Industrial methods of carrying out of polyreactions, physicochemical basics, apparatus, industrial

installations. Polymer isolation and purification processes. Preparation of polymers for processing. Production methods, properties, processing methods, applications of polymers obtained by chain polymerization: polyolefins (polyethylene, polypropylene, polyisobutylene, polydienes), polystyrene and styrene polymers, poly(vinyl chloride) and chlorovinyl polymers, polytetrafluoroethylene and fluorinated polymers, poly(vinyl acetate), poly(vinyl alcohol), polyvinyl acetals, acrylic polymers (polymethacrylates, polyacrylonitrile, polyacrylamide), polyoxomethylene.

Production methods, properties, processing methods, application of polymers obtained by step polymerization: polyamides (aliphatic, aromatic), polyesters (aliphatic, aliphatic-aromatic, aromatic), polycarbonates, unsaturated polyester resins, alkyd resins, phenol-formaldehyde resins, amino-formaldehyde resins, epoxy resins, polyurethanes, polysiloxanes.

Polymer modification.

The latest achievements in the field of polymer material technology and their technical applications. Applications of polymeric materials in various fields of technology (e.g. polymers in the construction of vehicles, aircraft, space technology, information recording, medicine, medical technology, etc.).

The laboratory classes covers the following issues:

Polymer composites. Structure, properties, forming methods, application of laminated materials. Types of binders, reinforcing materials, release agents used to obtain laminates. Radical polymerization (reaction mechanism, kinetics, technical methods of polymerization). Step polymerization (mechanism and kinetics of the reaction, technical methods of conducting polycondensation). Temperatures of phase transitions in polymers. Physicochemical basis of polymer modification.

1. Polymer composites - obtaining and testing the properties of polyester laminates.
2. Synthesis of gliptal resin modified by linseed oil.
3. Synthesis and study of the properties of PA 6.6.
4. Synthesis of poly(methyl methacrylate) by emulsion method.

The project covers the following issues:

Preparation of the project of a chosen plastic product, including a selection of the appropriate polymer, polymer production method (polymer production technology), processing method (presentation of the product production line with quality control) as well as directions of post-production and post-use waste management.

Teaching methods

Lecture: informative lecture with multimedia presentation.

Laboratory classes: performing experiments and getting acquainted with research equipment and chemical reagents used in their conduct.

Project: project method. Performing individual stages of the project using computer work, preparing multimedia presentations.
