

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Konstrukcje betonowe

Course

Field of study

Civil Engineering

Area of study (specialization)

Level of study

First-cycle studies

Form of study

part-time

Year/Semester

5/9

Profile of study

general academic

Course offered in

polski

Requirements

elective

Number of hours

Lecture

18

Laboratory classes

Tutorials

Projects/seminars

18

Other (e.g. online)

Number of credit points

4

Lecturers

Responsible for the course/lecturer:

dr inż. Jacek Ścigałło

Responsible for the course/lecturer:

Prerequisites

The student should have knowledge of mathematics, physics, chemistry, strength of materials and mechanics of buildings. He should also have the ability to obtain information from the indicated sources.

A student should have the ability to obtain information from the indicated sources, interpret them, draw conclusions, formulate and justify opinions and be ready to cooperate as part of a team.

A student should be aware of the responsibility for the reliability of the results of his / her work and their interpretation, should be ready to independently 2 supplement and expand knowledge in the field of construction, and should be aware of the need to increase professional and personal competences and understand the need for continuous training out.

Course objective

Acquiring skills in the design (construction and dimensioning) of simple bending, compression and tension elements of concrete structures in terms of the ultimate and serviceability limit states.

Course-related learning outcomes

Knowledge

1. Have the basics of general knowledge in mathematics, physics, chemistry, biology and other fields of science, forming theoretical principles appropriate to formulate and solve tasks related to building engineering - [P6S_WG (O)]
2. Knows detailed rules of constructing and dimensioning concrete elements and building facilities - [P6S_WG(I)]
3. Have advanced knowledge of construction theory and analysis of bar systems in the field of statics - [P6S_WG (I)]
4. Know the rules of constructing and analysing civil engineering - [P6S_WG (I)]
5. Have basic knowledge of the operation of algorithms used in selected software (including applications of BIM technology) supporting calculations, design of building structures - [P6S_WG (O/I)]

Skills

1. Can prepare statements of strengths influencing the building units and perform static analysis of statically determinate and non-determinate bar structures - [P6S_UW (I)]
2. Are able to correctly utilise numerical, analytical, simulation and experimental methods, in order to identify and solve problems in the field of building engineering; to obtain and verify the results - [P6S_UW (I)]
3. Are able to use advanced information and communication technologies (ICT) appropriate to perform typical engineering tasks - [P6S_UW (O/I)]
4. Are able to use modern software supporting the design decisions in building engineering, including programs based on the BIM technology; are able to critically estimate the results of numerical analysis of building facilities - [P6S_UW (O/I)]
5. Are able to design selected elements and simple concrete constructions, working individually or as part of a team - [P6S_UW (I)]
6. Can classify buildings building structures - [P6S_UW (O/I)]

Social competences

1. Understand the need of team work, are responsible for the safety of their own work and team's work - [P6S_KO (O)]
2. Take responsibility for the accuracy and reliability of work results and their interpretation - [P6S_KK (O)]
3. Are ready to autonomously complete and broaden knowledge in the field of modern processes and technologies of building engineering - [P6S_KR (O)]

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Examination of the content of the lecture in writing.

Design exercises (design of the core building elements - computer modeling of the structure):
substantive assessment of the project and assessment of defense.

Grading scale (max. 50 points):

45,5-50 very good (A)

42,5-45,4 good plus (B)

37,5-42,4 good (C)

32,5-37,4 sufficient plus (D)

25,0-32,4 sufficient (E)

less than 25 insufficient (F)

Programme content

Lecture:

Global analysis of stiffened and unstiffened structures according to Eurocode 2: geometric imperfections, geometrically nonlinear analysis - taking into account second-order effects, taking into account a nonlinear material model - the method of nominal stiffness. Bidirectionally bent flat slab ceilings - shaping, calculation and construction. Puncture of floor slabs and foundation slabs. Analysis of the building's spatial stiffness - stiffening walls and shafts. Foundation plates - inverted ceiling method.

Design exercises:

Design of core building elements with flat ceilings using computer modeling: ceilings, walls and shafts as well as foundation plates.

Teaching methods

Monographic lecture with multimedia presentation.

Design exercises - practical implementation of an engineering task. Preliminary discussion of the task, phased preparation of calculations and drawing documentation by students. Consulting and approving individual stages of work. Explaining repeated errors, ambiguities and doubts by the tutor to all students. The basis for passing the test is a systematic project, confirmed by an entry from the consultation, and its defense (oral or written form).

Bibliography

Basic

Breakdown of average student's workload

	Hours	ECTS
Total workload	100	4,0
Classes requiring direct contact with the teacher	38	1,5
Student's own work (literature studies, preparation for laboratory classes/tutorials, preparation for tests/exam, project preparation) ¹	62	2,5

¹ delete or add other activities as appropriate
