

COURSE DESCRIPTION CARD - SYLLABUS

Course name

FEM Analysis in Biomedical Problems

Course

Field of study

Biomedical Engineering

Area of study (specialization)

Level of study

First-cycle studies

Form of study

full-time

Year/Semester

2/4

Profile of study

general academic

Course offered in

english

Requirements

compulsory

Number of hours

Lecture

15

Laboratory classes

30

Other (e.g. online)

0

Tutorials

0

Projects/seminars

0

Number of credit points

3

Lecturers

Responsible for the course/lecturer:

dr hab. Tomasz Stręk

Responsible for the course/lecturer:

Institute of Applied Mechanics

Faculty of Mechanical Engineering

ul. Piotrowo 3, 60-965 Poznań

ul Jana Pawła II 24 (CMBiN - room 438)

email: tomasz.strek (at) put.poznan.pl

Prerequisites

Knowledge of mathematics, mechanics, fluid mechanics, strength of materials, heat transfer and differential equations, numerical methods. Skills of logical thinking, the use of information obtained from the library and the Internet. Social competencies of understanding the need for learning and acquiring new knowledge.

Course objective

The student should obtain knowledge of theoretical and computational fundamentals for solution of basic linear and non-linear partial differential equation problems modeling and governing technical, engineering and nature problems. Theoretical and practical knowledge of computing using finite element method/analysis to solve the basic problems of linear and nonlinear scientific and technical issues described by partial differential equations (stationary and non-stationary problems).

Course-related learning outcomes

Knowledge

Has basic knowledge of development trends in computer-aided engineering design, finite element methods (FEM), the use of FEM in computer-aided design, the use of computer graphics in the process of creating technical documentation.

Has basic knowledge of engineering design and engineering graphics, enabling the design of objects and processes, systems in terms of systems, machine elements; formulate and analyze problems; look for solution concepts; apply engineering calculations, select and evaluate solution variants; apply modeling, optimization and knowledge bases in engineering design, computer aided design process, technical devices and systems; describe their structure and operating principles.

Skills

Is able to obtain information from literature, databases and other properly selected sources (also in English or other foreign language) in the field of biomedical engineering; is able to integrate obtained information, interpret and critically evaluate information, as well as draw conclusions and formulate and fully justify opinions.

He is able to plan and carry out experiments, has the ability to computer modeling and simulation in biomedical engineering.

Social competences

Understands the need for lifelong learning; can inspire and organize the learning process of others.

Can interact and work in a group, taking on various roles.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture: Credit in writing on the basis of general questions or scores (credit in the case of obtaining 51% of points:> 50% - 3.0,> 60% - 3.5,> 70% - 4.0,> 80% - 4.5,> 90 % of points - 5.0) carried out at the end of

the semester. In the case of remote work, it may be implemented in the form of a technical problem developed and solved (using FEM) described in the selected scientific publication.

Laboratory / project: Assessment on the basis of the project of the developed problem / issues in the field of content of issues performed in the laboratory exercises. The form and quality of prepared materials is assessed (description of issues, theory, method, results, analysis and literature). The prepared data will allow calculations and graphical representation of the calculations.

Programme content

Lecture: Mathematical foundations of the finite element method. The essence of FEM. Calculation stages: "preprocessing-solving-postprocessing"; model analysis, solution and analysis of results. Generalized concept of finite elements method. Boundary issues for partial differential equations. Types of boundary conditions. Solving basic initial-boundary problems. Fundamentals of heat exchange. Basic mechanisms of heat exchange. Thermo-mechanical properties of materials. Modeling and simulation of heat transfer issues. Constitutive relationships of solids for 3D and 2D models. Modeling and simulation of the problem of solid state mechanics. Modeling and simulation of natural vibration forms. Modeling and simulation of thermal deformation issues. Modeling and simulation of fluid mechanics issues.

Laboratory: Solving engineering problems in the content of the lecture in a computer program (Comsol Multiphysics or another in the case of remote work). Computer and mathematical models (equations with initial-boundary conditions) will be prepared for the contents of the lecture presented in the laboratory. The prepared data will allow calculations and graphical representation of the calculations. Examples will relate to simple models used in biomedical engineering (e.g. simple foot prosthesis).

Teaching methods

Lecture: lecture / problem lecture / lecture with multimedia presentation.

The content of the lecture is presented in the form of a multimedia presentation in combination with a classic blackboard lecture enriched with shows related to the issues presented.

Computer laboratory: project method (research, implementation, practical project) / group work / task solving.

Breakdown of average student's workload

	Hours	ECTS
Total workload	100	3,0
Classes requiring direct contact with the teacher	45	1,0
Student's own work (literature studies, preparation for laboratory classes/tutorials, preparation for tests/exam, project preparation) ¹	55	2,0

¹ delete or add other activities as appropriate
