POZNAN UNIVERSITY OF TECHNOLOGY

EUROPEAN CREDIT TRANSFER AND ACCUMULATION SYSTEM (ECTS)

pl. M. Skłodowskiej-Curie 5, 60-965 Poznań

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Physicochemical basics of chemical and biochemical procesess

Course

Field of study	Year/Semester
Bioinformatics	2/4
Area of study (specialization)	Profile of study
	general academic
Level of study	Course offered in
First-cycle studies	polish
Form of study	Requirements
full-time	elective

Number of hours

Lecture	Laboratory classes	Other (e.g. online)
30	15	
Tutorials	Projects/seminars	
15		

Number of credit points

4

Lecturers

Responsible for the course/lecturer:

dr hab. Maciej Galiński, prof. PP

email: maciej.galinski@put.poznan.pl

phone + 48 61 66 52 310

Faculty of Chemical Technology

ul. M.Skłodowskiej -Curie 5, 60-965 Poznan

Responsible for the course/lecturer:

Prerequisites

have knowledge in general chemistry (writing chemical reactions, converting concentrations, knowledge of laboratory glassware and basic laboratory equipment)

have knowledge in mathematics and physics enabling the introduction of problems in physical chemistry (basic laws of physics, differential calculus).

are able to prepare solutions of specific concentrations.

are aware of further development of theirv2 ompetences

POZNAN UNIVERSITY OF TECHNOLOGY

EUROPEAN CREDIT TRANSFER AND ACCUMULATION SYSTEM (ECTS)

pl. M. Skłodowskiej-Curie 5, 60-965 Poznań

Course objective

To familiarise students with the physicochemical basics of chemical and biochemical processes at the academic level in the field of thermodynamics and chemical kinetics.

Course-related learning outcomes

Knowledge

basic biological phenomena and processes, and their mathematical interpretation on empirical grounds, using machine methods, including statistical and machine methods, K_W01

issues in the field of chemistry useful for the formulation and solving of simple bioinformatics tasks, covering the basic concepts and laws of chemistry, organic chemistry and biochemistry, K_W04

theoretical basis for modeling biological processes K_W17

Skills

obtain information from literature, databases and other properly selected sources, also in English, K_U01

integrate and interpret the information obtained, as well as draw conclusions and formulate and justify one's opinions K_U02

Social competences

lifelong learning and improving competences, K_K01

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture - multimedial presentation - exam

Laboratory classes: The course passing is based on points received for the individual exercise description. Passing exercises from 56% .

Execises: grade on the basis of points obtained for activity during classes, writing tests. Passing exercises from 75%

Programme content

LECTURES

1. Basic in thermodynamics - 1st Law of Thermodynamics.

Internal energy – total energy of a system. The difference of energy of products and substrates exchanged with the environment - the 1st Law of Thermodynamics. Heat and work as ways of energy exchange. The mean value of the thermal energy of particles. Maxwell-Boltzman distribution. Temperature definition and temperature scales. Thermodynamic temperature scale.

2. The second law of thermodynamics.

POZNAN UNIVERSITY OF TECHNOLOGY

EUROPEAN CREDIT TRANSFER AND ACCUMULATION SYSTEM (ECTS)

pl. M. Skłodowskiej-Curie 5, 60-965 Poznań

Definition of Entropy. Reversibility and irreversibility of the chemical processes. Total entropy change as the sum of the entropy changes of the system and the environment. The zero (third) law of thermodynamics

3. Thermodynamic potentials.

Spontaneous and forces processes. The concept of state functions and mathematical description. Isobaric, isochoric and adiabatic processes. Enthalpy, Free Enthalpy, Free Energy. The heat of isobaric and isochoric processes. When to use which function (p = const or v = const)

4. Thermochemistry.

Energetic effects of the chemical reactions. Heat capacity. Heat measurement - calorimetry. Heat value at constant volume Qp, heat value at constant pressure Qp. Dependence of the heat of isobaric and isochoric processes on temperature. Temperature dependence of heat capacity. The difference between Cp and Cv and Qp and Qv. Thermochemical equations. The heat of the process and chemical compounds.

5. Standardization of thermodynamic functions.

Arbitrary standard conditions (p = 1 atm, T = 298 K). Standard values of heat of reactions - rules for determining. Standard values of Entropy. Calorimetric measurement of the entropy. Determination of Enthalpy and Entropy values of chemical processes.

6. Mathematical relations of thermodynamic functions.

The dependence of free energy on temperature and volume. The dependence of the free enthalpy on temperature and pressure. The dependence of enthalpy on pressure. The dependence of pressure on volume and temperature. The dependence of internal energy on the volume.

7. Equilibrium of a chemical reaction.

Definition of chemical equilibrium. Equilibrium constant. Relation of the equilibrium constant with Fre energy and free enthalpy: the van't Hoff isotherm. Dependence of equilibrium constant on temperature, van't Hoff isobar and isochore. Pressure influence of equilibrium state. Examples. Calculation of equilibrium constant and efficiencies of the reaction based on thermodynamic data.

8. Kinetics - Elementary reactions.

Description of the rate of chemical reactions, the mechanisms and the influence of various factors on the rate of reaction. Molecularity. Order of reaction. Kinetic equations. The half-life of a chemical reaction.

9. Temperature dependencies.

 Influence of temperature on the speed of reaction - Energy of activation. Collision theory - Arrhenius equation. Steady-state theory - Eyring equation.

POZNAN UNIVERSITY OF TECHNOLOGY

EUROPEAN CREDIT TRANSFER AND ACCUMULATION SYSTEM (ECTS)

pl. M. Skłodowskiej-Curie 5, 60-965 Poznań

10. Kinetics - complex reactions.

Reversible reactions. Parallel reactions. Chain reactions. Explosion, explosive reaction mechanisms. Steady-state approximation. Oscillating reactions. Catalysis. Catalyst definition. Mechanism of catalytic reactions. Types of catalysis. Heterogeneous catalysis. Homogeneous catalysis. Enzymatic reactions. Examples.

CALCULATION EXCERSICE

students will calculate physicochemical parameters in the field of energetic effects of chemical reactions. equilibrium states, mathematical equations of chemical kinetics, calculations of concentrations values, determination of temperature influence of chemical and biochemical reactions.

LABORATORY CLASSES

Students will conduct four physicochemical experiments focused on the energetic aspects of chemical reactions as well as on the kinetic parameters of chemical reactions. Students will plan, conduct the experiment, analyses the results and draw conclusions.

Topics:

Heat reaction and measurement. General principles of thermodynamics. Heat values at constant pressure and constant volume conditions. Molar enthalpy of formation, combustion, dissolution dilution. Calorimetry. Construction and types of calorimeters.

Speed of the reaction, rate constant. Order and molecularity of reaction, Theory of collisions, steady-state theory. Temperature dependence of the speed of reaction. Eyring equation, Arrhenius equation. The energy of activation. Kinetic equations of 0th, 1st, 2nd and 3rd order.

Teaching methods

 Lecture - multimedial presentation.

Laboratory - practical method - laboratory exercises. Planning, execution and analysis of the results of physicochemical experiment

Exercises with discussion. Deductive method. The exercises involve solving partial tasks and solving detailed problems.

Breakdown of average student's workload

	Hours	ECTS
Total workload	100	4,0
Classes requiring direct contact with the teacher	60	2,5
Student's own work (literature studies, preparation for laboratory classes/tutorials, preparation for tests/exam, project preparation) [1]	40	1,5
