POZNAN UNIVERSITY OF TECHNOLOGY

COURSE DESCRIPTION CARD - SYLLABUS

Course name
Heat transfer in bioengineering

Course

Field of study	Year/Semester
Biomedical engineering	2/3
Area of study (specialization)	Profile of study
Engineering of implants and prosthesis	general academic
Level of study	Course offered in
Second-cycle studies	Polish
Form of study	Requirements
full-time	elective

Number of hours

Lecture	Laboratory classes	Other (e.g. online)
15	15	0
Tutorials	Projects/seminars	
0	0	

Number of credit points
2

Lecturers

Responsible for the course/lecturer:

dr hab. Tomasz Stręk

Institute of Applied Mechanics

Faculty of Mechanical Enginneering

ul. Piotrowo 3, 60-965 Poznań

ul Jana Pawla II 24 (CMBiN - room 438)

email: tomasz.strek (at) put.poznan.pl

Responsible for the course/lecturer:

POZNAN UNIVERSITY OF TECHNOLOGY

EUROPEAN CREDIT TRANSFER AND ACCUMULATION SYSTEM (ECTS)

pl. M. Skłodowskiej-Curie 5, 60-965 Poznań

Prerequisites

Knowledge of mathematics, mechanics, fluid mechanics, strength of materials, heat transfer and differential equations, finite element method. Skills of logical thinking, the use of information obtained from the library and the Internet. Social competencies of understanding the need for learning and acquiring new knowledge.

Course objective

Getting to know theoretical knowledge and acquisition of computational practice to solve problems of heat transfer and biotherm in biomedical engineering. Acquiring the ability to take into account the effects of heat and temperature on the body. Acquiring the ability to analyze the influence of thermal-mechanical properties on materials and biomedical devices.

Course-related learning outcomes

Knowledge

He has an ordered, theoretically founded knowledge of technical mechanics and computational fluid mechanics, which allows to calculate: elements of the theory of stress and strain, laminar and turbulent flow, flows through closed and open channels, Navier-Stokes equations, heat transfer and thermoelasticity issues.

Skills

He can use a mathematical apparatus to describe mechanical issues, structures and technological processes, can use the known methods and mathematical models, as well as computer simulations to analyze and evaluate the operation of elements and systems in devices.

Social competences

Is aware of the importance and understanding of non-technical aspects and effects of engineering activities, including its impact on the environment, and the related responsibility for decisions made.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture: Credit in writing on the basis of general questions or scores (credit in the case of obtaining 51% of points:> 50% - 3.0,> 60% - 3.5,> 70% - 4.0,> 80% - 4.5,> 90 % of points - 5.0) carried out at the end of the semester. In the case of remote work, it may be implemented in the form of a technical problem developed and solved described in the selected scientific publication.

Laboratory / project: Assessment on the basis of the project of the developed problem / issues in the field of content of issues performed in the laboratory exercises. The form and quality of prepared materials is assessed (description of issues, theory, method, results, analysis and literature). The prepared data will allow calculations and graphical representation of the calculations.

Programme content

Lecture: Heat transfer by conduction, convection and radiation. It exchanges heat in the liquid. It exchanges heat in organisms (biothermal equation). The flow of body fluid through a tissue or organ

POZNAN UNIVERSITY OF TECHNOLOGY

EUROPEAN CREDIT TRANSFER AND ACCUMULATION SYSTEM (ECTS)

pl. M. Skłodowskiej-Curie 5, 60-965 Poznań

(perfusion). Basic laws of heat conduction and thermal stresses. Mathematical models of heat transfer and thermal stresses. Boundary and initial conditions. Finite element method in the problems of heat transfer.

Laboratory: Solving engineering problems related to the content of the lecture in a computer program (eg Comsol Multiphysics). Computer and mathematical models (equations with initial-boundary conditions) for the analysis of the impact of temperature on human skin, modeling the cryotherapy and ablation treatment, and the influence of solar radiation on the body will be prepared for the laboratory content presented in the lecture. The prepared data will allow for calculations and graphical representation of the calculations.

Teaching methods

Lecture: lecture / problem lecture / lecture with multimedia presentation.

The content of the lecture is presented in the form of a multimedia presentation in combination with a classic blackboard lecture enriched with shows related to the issues presented.

Computer laboratory: project method (research, implementation, practical project) / group work / task solving.

Breakdown of average student's workload

	Hours	ECTS
Total workload	50	2,0
Classes requiring direct contact with the teacher	30	1,0
Student's own work (literature studies, preparation for laboratory classes/tutorials, preparation for tests/exam, project preparation) [1]	20	1,0
