

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Ecologicalistics

Course

Field of study

Logistics

Area of study (specialization)

Level of study

First-cycle studies

Form of study

full-time

Year/Semester

3/5

Profile of study

general academic

Course offered in

Polish

Requirements

elective

Number of hours

Lecture

15

Laboratory classes

Other (e.g. online)

Tutorials

15

Projects/seminars

Number of credit points

2

Lecturers

Responsible for the course/lecturer:

Ph.D., Eng. Magdalena Graczyk-Kucharska

Responsible for the course/lecturer:

Mail to: magdalena.graczyk-
kucharska@put.poznan.pl

Phone: 61 665 34 03

Faculty of Engineering Management

ul. J. Rychlewskiego 2, 60-965 Poznań

Prerequisites

The student has basic knowledge of environmental protection, logistics and organization and management sciences. Can Interpret and describe: phenomena that affect the company, its logistic processes and environmental protection. Can assess the manner of achieving goals while maintaining good relationships with partners and co-workers. Is aware of his/her knowledge of logistics, environmental protection and organization and management sciences and understands and analyses related basic social phenomena.

Course objective

The aim of the course is to familiarize students with the nature, objectives and methods of completing

ecologically-oriented logistic processes and systems of pro-ecological management of production processes.

Course-related learning outcomes

Knowledge

1. Student knows the basic relationships in logistics and its specific issues, i.e. ecology and pro-ecological supply chain management [P6S_WG_05]
2. Student is able to recognize and define the relationship between the technical and economic sphere characteristic of logistics and supply chain management in the context of waste management [P6S_WK_01]
3. Student knows the basic relationships in the field of logistics, ecology and supply chain management [P6S_WG_08]
4. Student is able to characterize best practices in logistics and pro-ecological process management in the supply chain [P6S_WK_06]
5. Student can indicate the basic relationships in force in logistics and ecology, including sustainable development and the logistics waste management system [P6S_WK_04]
6. Student knows the basic relationships and contemporary trends in the field of logistics, environmental science and its specific issues in the context of supply chain management [P6S_WK_05]

Skills

1. Student is able to search based on the literature of the subject and other sources and in an orderly manner present information on the problem falling within the scope of ecology and pro-ecological supply chain management [P6S_UW_01]
2. Student is able to prepare the work materials necessary to work in an industrial environment and knows the safety principles associated with this work, including safety problems in logistics [P6S_UW_05]
3. Student is able to make a critical analysis of a problem that falls within the scope of ecology and pro-ecological supply chain management [P6S_UW_06]
4. Student is able to design, using appropriate methods and techniques, an object, system or process that meets the requirements within the framework of ecology and pro-ecological supply chain management [P6S_UW_07]
5. Student is able to present, using properly selected means, a problem that falls within the scope of ecology and its specific issues, as well as pro-ecological supply chain management [P6S_UK_01]

Social competences

1. Student is aware of the recognition of the importance of knowledge in the field of ecology and pro-ecological supply chain management in solving cognitive and practical problems [P6S_KK_02]

2. Student is aware of initiating activities related to the formulation and transfer of information and cooperation in society in the field of ecology [P6S_KO_02]
3. Student is aware of the responsible fulfillment, correct identification and resolution of dilemmas related to the profession of logistics in the field of ecology [P6S_KR_01]
4. Student is aware of cooperation and work in a group on solving problems within the scope of ecology and pro-ecological supply chain management [P6S_KR_02]

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Lecture: Formative assessment: in the lecture, knowledge is verified in a partial form at the 3rd, 5th, 9th and 11th hour of the lecture in the form of four tests consisting of 3-6 test questions each (open and closed), variously scored, which together account for 40% of the value of the final lecture grade. Passing threshold of the formative assessment colloquium: 60%. Summative assessment: on the basis of the substantive quality of the pass in the last class conducted in written form (final colloquium), conducted in the form of a test consisting of 15-20 test questions each (open and closed), variously scored, which constitutes 60% of the value of the final assessment of the lecture. The threshold for passing the summative assessment colloquium: 60%.

Exercises: Formative evaluation: each time during the meeting on the basis of the discussion of the proposed solutions to the indicated problems in the field of ecology and at the 3rd, 8th, 10th hour of classes in the form of a partial evaluation of the tasks realized so far, which in total constitutes 30% of the final evaluation of the exercises. Summative evaluation: on the basis of a final evaluation consisting of a substantive evaluation of the partial tasks (50% of the final evaluation of the exercises) and a final public presentation during the last class and discussion of the results of the project (20% of the final evaluation of the exercises).

Programme content

Lecture: Conceptual assumptions of ecology. Sustainability. Circular economy. Logistics oriented internally and externally on the waste management system. Processes of recirculation of waste materials in the economy. Ecological balances in logistic systems. Logistics of municipal waste disposal and new technologies in waste management. Designing recycling-oriented products. Pro-ecological management systems. Logistic waste management system.

Tutorial: The impact of the company's location and activity on the environment. Designing an ecological product and ecological construction. The process of delivery, production and distribution in terms of waste and environmental impact. Categories and groups of waste in the enterprise. Internal waste logistics. Logistic system of waste management in the enterprise, including subsystems: collection, transport, recovery of waste and information flows. Documentation in the field of waste management in the enterprise. New technologies in the field of waste management.

Teaching methods

Lecture: multimedia presentation illustrated with examples given on the board - informative, problem-based lecture, work with a book, discussion.

Tutorial: multimedia presentation illustrated with examples given on the board, case study method, business stories - exercises and practical tasks.
