

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Material science

Course

Field of study

Aviation

Area of study (specialization)

Level of study

First-cycle studies

Form of study

full-time

Year/Semester

1/1

Profile of study

general academic

Course offered in

Requirements

compulsory

Number of hours

Lecture

30

Laboratory classes

15

Other (e.g. online)

0

Tutorials

Projects/seminars

Number of credit points

3

Lecturers

Responsible for the course/lecturer:

prof. dr hab. inż. Leszek Małdziński email:

leszek.maldzinski@put.poznan.pl

Responsible for the course/lecturer:

tel. 6166652238 Faculty of Civil Engineering and

Transport

Prerequisites

Knowledge: The student should have knowledge of basic sciences, i.e. physics and chemistry, as well as knowledge of subjects carried out at the first degree of studies, i.e. physical chemistry, thermodynamics, mechanics, material strength, aviation construction.

The student should demonstrate the general ability to identify problems, create algorithms, ways of solving them and the ability to solve engineering tasks. The student should understand the basic phenomena occurring in solids, be able to identify and characterize them.

Social competences: The student is ready to deepen the knowledge of interdisciplinary subjects. The student is open to learning about new technologies and engineering solutions.

Course objective

The aim of the course is to familiarize students with metals, plastics, ceramics and composites. In particular, getting acquainted with their structure and properties.

Course-related learning outcomes

Knowledge

1. has basic knowledge of metal, non-metal and composite materials used in machine construction, in particular about their structure, properties, methods of production, heat and thermo-chemical treatment and the influence of plastic processing on their strength, as well as fuels, lubricants, technical gases, refrigerants e.t.c.

Skills

1. is able to properly plan and perform experiments, including measurements and computer simulations, interpret the obtained results, and correctly draw conclusions from them

Social competences

1. understands that in technology, knowledge and skills very quickly become obsolete

2. is aware of the social role of a technical university graduate, in particular understands the need to formulate and provide the society, in an appropriate form, with information and opinions on engineering activities, technological achievements, as well as the achievements and traditions of the engineer profession

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

Written verification

Programme content

Classification of basic groups of engineering materials: metals and their alloys, plastics, ceramics and glass, composites.

Technical metals and metal alloys. Crystalline structure and polymorphism. Kinds of crystalline structure defects and their influence on the properties. Phases in metal alloys – solid solutions, carbides, nitrides, intermetallic phases, non-metallic inclusions. Phase equilibrium systems and their practical utilization for the selection of alloy microstructure and properties. Fe-Fe₃C diagram. kinds of phases in iron alloys. Transformations taking place in steels. Carbon steels, alloy steels. Cast steels. Cast irons. Hardenability, influence of alloy additives on steel hardenability. Purposes and bases of heat treatment operations. Basic kinds of heat treatment. Kinds of annealing. Hardening and tempering. Non-ferrous metals. Application of metals in aviation construction.

Plastics, polymer structure, covalent and van der Waals bonds, crystalline and amorphous structure, manufacturing methods, polymer processing, molding, properties, types (plastomers, elastomers), examples of use.

Selected properties of ceramic materials and composites their assessment: general properties (density,

viscosity, melt index, mechanical properties (yield stress, elongation relative at the yield point, tensile strength, modulus of elasticity in tensile, bending strength), impact strength (Charpy, Isolde method), hardness (Rockwell, pressing the ball).

Selected properties of ceramic materials; dielectricity, poor electrical conductivity, resistance to heat shocks, asymmetry of compressive and tensile strength

Processing of ceramics; forming by: rolling, drawing, spreading, blow ironing, glass fiber drawing, isostatic ironing (e.g. candles ignition), extruding with a screw press, turning (in plaster and on a mold plaster), casting in plaster mold. Special ceramic materials and their properties and used in industry: carbon fibers, diamond, nanotubes, fullerenes.

Special types of composites, their properties and application: metal matrix composites particle hardening, dispersion hardening, sinters based on non-ferrous metals, metal-ceramic, sintered carbides, cermets, fiber composites, layer composites.

Composites manufacturing methods:

Selection of engineering materials for the construction of selected engineering structures: for a beam, for a mirror telescope, on some elements of the car (bodywork, bumpers), on elements of houses (e.g. walls external-bearing).

Teaching methods

Lecture with multimedia presentation
