

COURSE DESCRIPTION CARD - SYLLABUS

Course name

Means of transport operation

Course

Field of study

Aviation

Area of study (specialization)

Air Traffic Management

Level of study

First-cycle studies

Form of study

full-time

Year/Semester

2/4

Profile of study

general academic

Course offered in

Polish

Requirements

compulsory

Number of hours

Lecture

30

Laboratory classes

15

Other (e.g. online)

0

Tutorials

15

Projects/seminars

0

Number of credit points

4

Lecturers

Responsible for the course/lecturer:

dr inż. Paweł Komorski

Responsible for the course/lecturer:

pawel.komorski@put.poznan.pl

Wydział Inżynierii Lądowej i Transportu

ul. Piotrowo 3, 60-965 Poznań

Prerequisites

Knowledge: Basic knowledge of physics, construction and principles of air transport operation.

Skills: Is able to analyze the interdependencies between the effects and causes of phenomena and events resulting from the laws of physics. Has basic soft skills.

Social competences: Prepared for teamwork.

Course objective

The aim of the course is to familiarize students with the issues related to the exploitation of air transport means. Acquainting with the formulation and solving of problems related to the operation of means of transport, in particular with the aspects of aircrafts using and servicing (maintenance).

Course-related learning outcomes

Knowledge

1. Has ordered, theoretically founded general knowledge of technology and various means of air transport, about the life cycle of means of transport, both hardware and software, and in particular about the key processes taking place in them.
2. Has ordered and theoretically founded general knowledge in the field of key technical issues and detailed knowledge of selected issues related to air transport, knows the basic techniques, methods and tools used in the process of solving tasks related to air transport, mainly of an engineering nature.

Skills

1. Can obtain information from various sources, including literature and databases, both in Polish and in English, integrate them properly, interpret and critically evaluate them, draw conclusions and exhaustively justify their opinions.
2. Can properly plan and perform experiments, including measurements and computer simulations, interpret the obtained results, and correctly draw conclusions from them.
3. Can analyze objects and technical solutions, can search in catalogs and on manufacturers' websites ready components of machines and devices, including means and devices, assess their suitability for use in own technical and organizational projects.
4. Is able to formulate and solve tasks related to civil aviation, apply appropriately selected methods, including analytical, simulation or experimental methods.

Social competences

1. Understands that in technology, knowledge and skills very quickly become obsolete.
2. Is aware of the importance of knowledge in solving engineering problems, knows examples and understands the causes of malfunctioning engineering projects that have led to serious financial and social losses, or to a serious loss of health and even life.
3. Is aware of the social role of a technical university graduate, in particular understands the need to formulate and convey to the society, in an appropriate form, information and opinions on engineering activities, technological achievements, as well as the achievements and traditions of the engineer profession.
4. Correctly identifies and resolves dilemmas related to the profession of aerospace engineer.

Methods for verifying learning outcomes and assessment criteria

Learning outcomes presented above are verified as follows:

To pass the lecture, Student should receive at least 51% of positive answers by completing a final test. Additionally, activities during lectures, such as substantive discussion and ongoing preparation for classes, are rewarded.

Completion of other lecture forms based on the final test and reports on work during each exercise.

Programme content

1. Basic information and definitions concerning the technical operation of transport vehicles.
2. Aircrafts attributes and properties.
3. Reliability and unreliability of aircrafts. Reliability indicators and structures in operation.
4. Aircrafts malfunctions and damages.
5. Aircrafts readiness.
6. Aircrafts suitability.
7. Durability and viability of aircrafts.
8. Aircrafts diagnostic susceptibility.
9. Basic diagnostics of aircraft drive systems.
10. Costs in the operation of transport means.
11. Supply chains and storage in operation.

Teaching methods

1. Lectures - multimedia presentation with a discussion
2. Tutorials - tasks solving, case study and teamwork
3. Laboratory classes - implementation of experimental tasks of a practical nature regarding methods of operating transport means, work in groups

Breakdown of average student's workload

	Hours	ECTS
Total workload	100	4,0
Classes requiring direct contact with the teacher	60	2,5
Student's own work (literature studies, preparation for classes, preparation for tests,) ¹	40	1,5

¹ delete or add other activities as appropriate
